Day 19 – Case Study Assignment

Topic: Introduction to Angular & Core Building Blocks

User Story

As a **content manager** for **EduLearn**, I want to create a **course management SPA (Single Page Application)** where I can **view a list of courses** and **update course details dynamically**, so that learners can see the latest information without refreshing the page.

Scenario

- You are tasked with building a **basic Angular application** for EduLearn.
- The app should have:
    1. **App Module** as the root module.
    2. **CourseListComponent** to display all available courses.
    3. **CourseDetailComponent** to show details of a selected course.
- Use **Property Binding** to pass the selected course's details to the detail view.
- Use **Event Binding** so that when a button is clicked in the course list, the details update in the detail component.
- Use **Two-Way Binding** in CourseDetailComponent so the course title can be edited in real time and reflected in the UI.

Learning Goals

By completing this case study, learners will:

1. Understand Angular's **component-based architecture**.

Proprietary content. © Great Learning. All Rights Reserved. Unauthorized use or distribution prohibited.

2. Learn to organize **modules and components** properly.

3. Use **property binding**, **event binding**, and **two-way binding** to build interactive templates.

4. Understand the role of components in a **Single Page Application**.

Assignment Instructions

1. Install Angular CLI and create a **new Angular application**.

2. Create the following components:

    - CourseListComponent – Displays a list of courses with a "View Details" button for each.

    - CourseDetailComponent – Shows and edits the selected course details.

3. Use:

    - **Property Binding**: Pass selected course data from CourseListComponent to CourseDetailComponent.

    - **Event Binding**: Capture button clicks in CourseListComponent to change the selected course.

    - **Two-Way Binding**: Allow editing the course title in CourseDetailComponent with changes reflected immediately in the list.

4. Keep the UI simple but ensure the **data binding** works as expected.

Submission Guidelines

- **Folder Structure**: Submit the full Angular project folder (zipped).

- **File Naming**: Follow Angular's naming conventions (course-list.component.ts, course-detail.component.ts, etc.).

- **README File**: Include:

    - Steps to install dependencies and run the app.

Proprietary content. © Great Learning. All Rights Reserved. Unauthorized use or distribution prohibited.

- Short explanation of where and how you used property binding, event binding, and two-way binding.

- **Deadline**: Submit by **EOD of Day 19**.

- **Evaluation Criteria**:

  - Correct project setup & CLI usage (20%)

  - Proper module & component structure (20%)

  - Correct implementation of binding types (40%)

  - Code readability & README (20%)
